

SYSTEM AND METHOD FOR DYNAMIC UPLOADING AND EXECUTION OF
APPLICATIONS AND DRIVERS BETWEEN DEVICES

ABSTRACT OF THE DISCLOSURE

5 A methodology for dynamic (i.e., run-time) uploading and execution of
applications and drivers between devices (e.g., between “client” device and one or more
(host) devices), in a fully automated manner, is described. The device which is to be hosted
(e.g., the “client” device) initially probes its environment to determine which device or
10 devices it is attached to (e.g., the “host” device(s)). Once it has correctly discerned the
relevant host or target device(s), the client device includes the capability of immediately
sending out (i.e., uploading) a particular driver or application (i.e., object or file of interest)
for placement, and ultimately execution, at the host device. Once the particular object or file
of interest has been “injected” into the host device and is executing, the client device may
15 simply revert to a “listening mode” in which it waits to be told what to do (i.e., receive
commands from the application or driver which is now executing at the host device). This
approach is particularly well-suited for devices which serve as “add-on” devices (clients) to
other devices (hosts) that are “smarter,” for instance, including more processing capability
and/or memory. In this scenario, the client device enters into a dialog with a device with
20 more resources for the purpose of harnessing the resources of the host device for operating
the client or add-on device. The client device is, using this approach, able to start running
(i.e., driver-directed operation) immediately upon attachment to a host device that can be
identified.
